Country : Spain
Project ID : P0041878/0001 Project Established
ICS :
National Ref : PNE 41531 IN
Title : Accessibility of the immovable Cultural Heritage. General concepts and references and methodology.
Scope : The aim of this Report is the accessibility of the immovable Cultural Heritage, with respect to its values. It provides architectural and construction criteria, having in mind that usually the actual accessibility cannot be gotten without complementing the built environment with actions regarding use, management, organisation, sensitization, TIC tools, etc. , which are out of the scope of this document. Accessibility has to be understood in a broad sense. Therefore, to be effective, the actions on the Cultural Heritage need to be coordinated with other actions on its environment. This Report is a worktool for the different agents involved: curators and restorers of the Cultural Heritage, designers, builders, public administrations, facility managers, etc.

Title : Standard test methods for determining the inclusion content of steel
Scope : These test methods cover a number of recognized procedures for determining the nonmetallic inclusion content of wrought steel. Macroscopic methods include macroetch, fracture, step-down, and magnetic particle tests. Microscopic methods include five generally accepted systems of examination. In these microscopic methods, inclusions are assigned to a category based on similarities in morphology, and not necessarily on their chemical identity. Metallographic techniques that allow simple differentiation between morphologically similar inclusions are briefly discussed. While the methods are primarily intended for rating inclusions, constituents such as carbides, nitrides, carbonitrides, borides, and intermetallic phases may be rated using some of the microscopic methods. In some cases, alloys other than steels may be rated using one or more of these methods; the methods will be described in terms of their use on steels.

Title : Acoustics - Sound classification of spaces in buildings - Dwellings
Scope : The standard categorizes requirements imposed on homes on airborne sound insulation, impact sound level, sound pressure level from indoor installations, insulation against external noise sources, sound pressure level outside the house and on the patio and reverberation. Other types of buildings addressed in Swedish Standard SS 02 52 68 ; Acoustics - Sound classification of spaces in buildings - Institutional premises, rooms for education, preschools and leisure-time centers, rooms for office work and hotels. The different requirements are divided into four classes. Class C indicates the minimum level applied by the authorities, Class D concerns including older buildings and classes A and B specifies requirements for particularly good acoustic conditions. Between sound classes, the difference is typically 4 dB, in addition there are some adjustments in the scope of the claims.

Title : Acoustics - Sound classification of spaces in buildings - Institutional premises, rooms for education, preschools and leisure-time centres, rooms for office work and hotels
Scope : The standard categorizes requirements imposed on business premises on airborne sound insulation, impact sound level, room acoustics, sound pressure level from indoor installations, as well as sound insulation against external noise sources. The requirements are divided into four audio classes. For sound classification of dwellings, see Swedish standard SS 25267; Acoustics - Sound classification of spaces in buildings – Dwellings. Objective of the standard is to:

- Be complementary to the Swedish national building regulation (BBR) and facilitate the planning, design, production and control;
- Provide opportunities for quality assurance of the sound environment, and thus enable quality declaration of premises for specified activities,
- Clarify responsibilities between the building process actors,
- Help developers / users to ask relevant sound requirements.

Title : Workplace exposure. Determination of airborne particles (inhalable, thoracic and respirable fractions). Gravimetric method.

Scope : This standard describes the procedure and equipment for the determination of the airborne particles at the workplace through the sampling on an appropriate collection substrate and their gravimetric quantification. The standard is applicable to all of the airborne particles whose analysis requires gravimetric determination and it allows the determination of the health related fractions defined in UNE-EN 481 when the appropriate aerosol samplers were used. The procedure of measurement described can be used to carry out measurements to determine the occupational exposure concentration, measurements for comparison with limit values (occupational) to evaluate the exposition via inhalation and periodic measurements. It may also be used to carry out screening measurements of time weighted average concentration (see UNE-EN 481, 4.2) and screening measurements of variation of concentration in time and/or space (see UNE-EN 481, 4.3).

Title : Workplace exposure. Determination of crystalline free silica (respirable fractions) in the air. Method by infrared spectrometry

Scope : This standard describes the procedure and equipment for the determination of the respirable fraction of crystalline free silica at the workplaces. Samples are collected on a PVC filter using a respirable sampler and analysed by infrared spectrophotometry. The field of application of the analysis ranges from 10 micrograms to 500 micrograms of crystalline free silica in the collected sample. Then the procedure allows to determine concentrations of crystalline free silica (respirable fraction) from 0,02 mg/m³ to 1,0 mg/m³ for an air sample volume of 500 l.

The procedure of measurement described can be used to carry out measurements to determine the occupational exposure concentration, measurements for comparison with limit values (occupational) to evaluate the exposition via inhalation and periodic measurements. It may also be used to carry out screening measurements of time weighted average concentration (see UNE-EN 481, 4.2) and screening measurements of variation of

Title : Evaluation of biodegradability of dispersants and bioremediation agents by determination of biological oxygen demand in a manometric respirometer

Scope : This standard specifies a method for the evaluation of the ultimate biodegradability of dispersants and bioremediation agents under the action of aerobic microorganisms, by measuring the biological oxygen demand (BOD) in a manometric respirometer for 28 days. This method applies to dispersants and bioremediation agents and is meant to assess the biodegradability of the product through a BOD/COD (chemical oxygen demand) ratio.
